

## SolarMax Energy Systems

# Appearance and price of p-type photovoltaic panels

## Overview

---

Most P-type and N-type solar cells are the same, featuring slight and very subtle manufacturing differences for N-type and P-type solar panels. In this section, you will learn about the difference between these two.

What is the difference between n-type and P-type solar panels?

N-type solar panels are harder to source and generally only produced by a handful of manufacturers that have invested in the newer production methods. One key difference between N-type and P-type solar cells is their degradation rates over time. P-type solar cells tend to degrade faster than N-type cells.

What are the different types of photovoltaic panels?

In general, photovoltaic panels are classified into three main categories: monocrystalline, polycrystalline and thin-film panels. Each of them has particularities that make them more or less suitable depending on the environment and the objective of the project. Monocrystalline panels are manufactured from a single crystal of pure silicon.

Why are n type panels more expensive than P type panels?

**Higher Cost:** N-Type panels are currently more expensive due to the time-consuming and complex manufacturing process. **Limited Research and Testing:** These panels are still being researched and are not as widely tested or understood as P-Type panels. To understand P Type and N Type panels, we need to delve into some details.

How do I know if my solar panel is p-type or n-type?

The type (P-Type or N-Type) should be listed under the panel's technical details. Many solar panels come with a barcode or QR code printed on them. You can scan this code using a smartphone or a barcode scanner.
