Base station battery size

Overview

Which battery is best for telecom base station backup power?

Among various battery technologies, Lithium Iron Phosphate (LiFePO₄) batteries stand out as the ideal choice for telecom base station backup power due to their high safety, long lifespan, and excellent thermal stability.

What makes a telecom battery pack compatible with a base station?

Compatibility and Installation Voltage Compatibility: 48V is the standard voltage for telecom base stations, so the battery pack's output voltage must align with base station equipment requirements. Modular Design: A modular structure simplifies installation, maintenance, and scalability.

How do I choose a base station?

Key Factors: Power Consumption: Determine the base station's load (in watts). Backup Duration: Identify the required backup time (hours). Battery Voltage: Select the correct voltage based on system design. Efficiency & Discharge Rate: Consider battery efficiency and discharge characteristics.

How do you calculate battery capacity?

Formula: Capacity (Ah) = Power (W) × Backup Hours (h) / Battery Voltage (V)
Example: If a base station consumes 500W and needs 4 hours of backup at 48V, the required capacity is: $500W \times 4h / 48V = 41.67Ah$ Choosing a battery with a slightly higher capacity ensures reliability under real-world conditions.

What is a wide temperature range LiFePO₄ battery?

This translates to lower replacement frequency and maintenance costs. Wide Temperature Range LiFePO₄ batteries operate reliably in temperatures ranging from -20°C to 60°C, making them suitable for the diverse and often extreme environments of telecom base stations.

What makes a good battery management system?

A well-designed BMS should include:

- Voltage Monitoring:** Real-time monitoring of each cell's voltage to prevent overcharging or over-discharging.
- Temperature Management:** Built-in temperature sensors to monitor the battery pack's temperature, preventing overheating or operation in extreme cold.
