**Base station power supply has
no output power supply**

Overview

Why is my power supply not outputting DC power?

If a power supply is not outputting DC power (12 or 24VDC at the main board lower right terminals), there are several potential causes. First, check the AC wire connections and ensure they are properly connected and receiving the correct incoming voltage. Additionally, check the 4 Ampere “Slo Blo” Fuse.

How do I know if my power supply is failing?

Check to see that you have 28 volts across the charging terminals. If not, your power supply could be dinked. Yeah, the power supplies are known to fail.

How much power does a PSU need?

This is when the PSU is no longer powering the PA, which is the main power draw, but still needs to power other electronics. The current target for low-load efficiency is about 30 W. Some OEMs would like to see that drop to nearly 10 W.

How much power does a PSU need during a quiescent period?

During quiescent periods—typically 5 ms to 100 ms—the PSU must minimize all load power with the basic functions of the antenna unit remaining active. It also must be able to ramp up to full power whenever the antenna wants to check for any active users within its range.

Base station power supply has no output power supply

Replacement Headset Power Adapter for the Valve Index

Also the polarity has to match, not just the volts/amps Right, I have figured out that much. I need a negative out/positive core polarity, but it's also my understanding that nearly every power ...
