

## SolarMax Energy Systems

# Black Mountain Polycrystalline Solar System Integration

## Overview

---

What is the difference between monocrystalline and polycrystalline solar panels?

The primary difference in aesthetics between the two types of solar panels is their color: monocrystalline panels are usually black, while polycrystalline panels can appear to have a blue hue. The type of silicon cell that makes up your solar panels usually has no impact on the panels' lifespan.

What are polycrystalline solar panels?

Polycrystalline solar panels are made by fusing multiple small pieces of silicon to create the solar cells. Polycrystalline panels are less expensive than monocrystalline panels, but also less efficient and less durable. The best applications for polycrystalline panels are large-scale operations like solar farms, where space isn't a concern.

Why do polycrystalline solar panels need more space?

However, due to higher efficiency, more polycrystalline panels are required to match the equivalent energy of monocrystalline solar panels, meaning that inevitably, more panels and space for those panels are required.

**Manufacturing Process:** Monocrystalline panels are made from a single, pure silicon crystal structure.

Are polycrystalline solar panels suitable for residential installations?

Yes, polycrystalline solar panels are suitable for residential installations. In fact, polycrystalline is the second most common panel type used in homes. Polycrystalline panels have a moderate efficiency of 13-16%, which is less than monocrystalline (meaning they require more space to produce the same power).

Why are polycrystalline solar panels blue?

The blue color of poly panels is a result of their cell structure. Efficiency of

13-16%: The efficiency of polycrystalline panels is high, at 13-16%, but is still lower than some other solar panel types.

Are black panels better than monocrystalline panels?

Aesthetics: Sleek and uniform, black panels are often considered more aesthetically pleasing. Cons: Cost: Generally, monocrystalline panels are more expensive due to the manufacturing process and the quality of silicon used.

Pros:
