# **China Solar Base Station Case ESS Power Base Station**

## Overview

---

Can a base station power system be optimized according to local conditions?

The optimization of PV and ESS setup according to local conditions has a direct impact on the economic and ecological benefits of the base station power system. An improved base station power system model is proposed in this paper, which takes into consideration the behavior of converters.

Can a base station power system model be improved?

An improved base station power system model is proposed in this paper, which takes into consideration the behavior of converters. And through this, a multi-faceted assessment criterion that considers both economic and ecological factors is established.

Are energy storage projects with Second-Life Electric Vehicle batteries allowed in China?

Discussion In June 2021, The NEA of China released a new regulation on energy storage , claiming that “in principle, no new large-scale energy storage projects with second-life electric vehicle batteries are allowed”. This statement suggests that the administration on ESSs is gradually shifting from encouraging to tightening, but not banned.

How ESS is connected to a base station?

Scheme 1: The classic scheme in which the base stations are only powered by grid electricity. Scheme 2: The PV modules are connected in series to obtain higher voltage and are connected to the AC bus of the base station through an inverter with MPPT function. ESS is connected to the 48 V DC bus through bidirectional DC/DC converter.

Does loss of power converters affect the optimization of base station PV and ESS?

The main conclusions are as follows: The loss of power converters significantly

affects the optimization of base station PV and ESS. Calculating with a fixed efficiency cannot accurately reflect the actual situation. The proposed evaluation method achieves a balance in LCC, initial investment, return on investment, and carbon emissions.

What happens if PV capacity is less than base station load?

When the installed PV capacity is less than the base station's daily load, the return on investment of PVs remains relatively stable, but it gradually decreases as the installed PV capacity increases. The return on investment of adding ESS is consistently lower than that of PVs, but its trend is different.
