Comparison of the number of 5G communication base stations in Tonga

Overview

What is 5G and how does it work?

5G is the fifth generation of mobile phone communications standards. It is a successor to 4G and promises to be faster than previous generations while opening up new use cases for mobile data.

What is the difference between 4G and 5G?

The high data transfer rates make 4G networks suitable for use in USB wireless modems for laptops and even home internet access. 5G is the fifth generation of mobile phone communications standards.

What is 4G and how does it work?

4G is the fourth generation of mobile phone communications standards. It is a successor of the 3G and provides ultra-broadband internet access for mobile devices. The high data transfer rates make 4G networks suitable for use in USB wireless modems for laptops and even home internet access.

What is 2G and how does it work?

Please select the country you are interested in: 2G, first introduced in 1992, is the second-generation of cellular telephone technology and the first to use digital encryption of conversations. 2G networks were the first to offer data services and SMS text messaging, but their data transfer rates are lower than those of their successors.

What is the difference between 3G and 4G?

3G networks succeed 2G ones, offering faster data transfer rates and are the first to enable video calls. This makes them especially suitable for use in modern smartphones, which require constant high-speed internet connection for many of their applications. 4G is the fourth generation of mobile phone communications standards.
