

## SolarMax Energy Systems

# Electricity consumption in manufacturing energy storage batteries

## Overview

---

Lithium-ion battery factories consume roughly 30 to 65 kWh of electricity per kWh of battery capacity produced, with some recent studies indicating values around 30–35 kWh/kWh, while others report higher figures up to 50–65 kWh/kWh depending on production scale and technology used. How much energy does a battery use?

When compared, the industrial scale battery manufacturing can reach an energy consumption as low as 14 kWh/kg battery pack, representing a 72% decrease in the energy consumption, mainly from the improved efficiency relative to the increased production scale.

How much energy does a battery manufacturing facility use?

Dai et al (2019) estimate the energy use in battery manufacturing facilities in China with an annual manufacturing capacity of around 2 GWh c to 170 MJ (47 kWh) per kWh c, of which 140 MJ is used in the form of steam and 30 MJ as electricity. Ellingsen et al (2015) studied electricity use in a manufacturing facility over 18 months.

Can a new battery cell production technology save energy?

However, new product and production technologies can optimize battery cell production to achieve savings of up to 66 percent, equivalent to the energy consumption of Belgium or Finland (in 2021). These groundbreaking results have now been published in the world-renowned journal “Nature Energy”.

How will energy consumption of battery cell production develop after 2030?

A comprehensive comparison of existing and future cell chemistries is currently lacking in the literature. Consequently, how energy consumption of battery cell production will develop, especially after 2030, but currently it is still unknown how this can be decreased by improving the cell chemistries and the production process.

How will battery technology affect energy consumption?

Fourth, owing to large investments in battery production infrastructure, research and development, the resulting technology improvements and techno-economic effects promise a reduction in energy consumption per produced cell energy by two-thirds until 2040, compared with the present technology and know-how level.

How much energy does a battery pack consume?

The specific energy consumption of compressed air is set at 4 cfm/hp, and an average power factor of 0.85 is used in calculating the electricity energy consumption. After the battery cells manufactured, the manual assembly of the battery pack consumes 3.9 Wh/kg energy for welding and screwing . 3.1.
