What should NREL consider when testing energy storage systems?

Photo by Owen Roberts, NREL Considerations for energy storage system testing include the following. If cost-justified by a large purchase, consider qualification testing of battery systems. Include test conditions in specifications for battery O&M diagnostics and testing.

What is a battery energy storage system?

Battery energy storage systems (BESS) stabilize the electrical grid, ensuring a steady flow of power to homes and businesses regardless of fluctuations from varied energy sources or other disruptions. However, fires at some BESS installations have caused concern in communities considering BESS as a method to support their grids.

Do energy storage products need periodic maintenance?

The requirements for periodic maintenance for energy storage products should be identified by the OEM (IEEE 2010). In settings where predictive analytics maintenance is economical, guidance should also be available from the manufacturer that identifies methodologies for assessing when a product may be approaching a failure mode.

Why is energy availability important in assessing PV systems?

Both energy and availability are necessary metrics for assessing PV systems. If the stakeholders involved in a contract are most interested in energy production, and if the contract holds parties responsible for energy production, then it is crucial that energy losses associated with unavailability and system performance are accounted for.

How should a battery enclosure be maintained?

Battery manufacturers recommend the temperature and humidity levels which should be maintained in the battery enclosure. Additionally, as with inverters

and their air intake, it is also important to keep battery vents clear.

How can a building preventative maintenance program be effective?

Consider switching to day-cleaning, which takes place while occupants are in the building and has shown to also reduce complaints. Review and emphasize the financial and environmental results of a preventative maintenance program for major systems and components. Set goals and a methodology to track and reward improvements.
