

## SolarMax Energy Systems

# External discharge DC inverter

## Overview

---

Why do EV inverters need to be discharged?

Abstract: when an Electrical Vehicle (EV) encounters an accident or the vehicle is taken to a service station, the DC-link capacitor in the inverter must be discharged to ensure safety of both the passengers and the operator.

How is power dissipated in an inverter?

The power dissipated by the the inverter's housing or through a cooling system. the current. The discharge energy is used to charge the Low-voltage battery (12 V) used as an auxiliary battery. the Flyback transformer. A charging current of 1C is used to Ampere hours (Ah). The blue trace in Fig.1 illustrates the energy.

What is a DC-link capacitor in a traction inverter?

Figure 1. Simplified Block Diagram of a Traction Inverter The DC-Link capacitor is a part of every traction inverter and is positioned in parallel with the high-voltage battery and the power stage (see Figure 1). The DC-Link capacitor has several functions, such as to help smooth voltage ripples, filtering unwanted harmonics and reducing noise.

How is a DC-link capacitor discharged?

Below the to prevent resurge in voltage on the DC-Link capacitor. setup. 920V for both test setups of concept 1 and 2, using a contactor. link. The capacitor is then discharged through the flyback discharge using either variant 1 or variant 2. activation. However, certain applications may require a shorter discharge time.

Does a DC-link capacitor have a voltage surge?

This method has no voltage surge, but the discharge time is longer than 5 s. The DC-link due to negative injection. The proposed hybrid risk of permanent demagnetization. The i was set in accordance DC-Link capacitor

voltage drops below 60 V. With the help of based method with maximum power discharge. Moreover, the.

What happens to DC-link voltage flyback converter during discharge phase?

As a consequence of the DC-link voltage flyback converter's output power during the discharge phase, is subjected to load conditions. Fig. 2. Flowchart of d-q current reference implemented during Discharge. further minimize transient power fluctuations. methods initiated at the maximum speed. The first winding-
