# How does the energy storage cabinet power the charging pile

## Overview

What is an EV charging pile?

An EV charger or charging pile is a unit intended for supplying electric energy to an electric vehicle that requires charging in order to increase its stored energy. They act as intermediaries between the power grid and an electric vehicle (EV), controlling the current and voltage supply to ensure that charging is done efficiently and safely.

What are the components of a charging pile?

A charging pile comprises several components which are crucial for its operational functionality and security features: Power Supply Module – Converts and stabilizes the energy from the grid. Charge Controller – Smartly operates the voltage, current, and communication functions between the vehicle and the charging pile.

Why do EV owners need a private charging pile?

The effectiveness of PV energy sources is also substantially grown because an abundant charging network encourages the application of clean energy in place for fossil fuels, contributing to lower carbon emissions around the world. The installation of a private charging pile is economically beneficial to EV owners.

What is the difference between charging pile and charging station?

Although “charging pile” and “charging station” are occasionally used interchangeably, they describe different ideas. A charging pile is the basic component of an electric power infrastructure that allows electricity to flow to the vehicle.

What is an AC charging pile?

Therefore, the AC charging pile can be understood as a set of connection and control equipment with a protection system. It implements a unified electrical

protocol (national standard regulations) to communicate with the on-board charger to achieve functions such as opening and closing the scheduled charging.

How does a car battery charger work?

After the charging gun head is inserted into the slow charging interface of the car, the AC charging pile sends the AC power to the on-board charger, which converts the AC power into DC power and cooperates with the car battery management system (BMS) to complete the battery charging.
