

## SolarMax Energy Systems

**How long does it take to  
convert base station batteries  
to solar power**

## Overview

---

How does a solar battery storage system work?

To help balance the potential electricity draw, energy storage systems can automatically detect charging events and discharge power to avoid creating a demand spike. Capacity - Battery storage capacity is the total amount of electricity that a solar battery can store. The amount of capacity a battery has is measured in kilowatt-hours (kWh).

Can a solar battery be added to a home solar system?

Most home solar batteries are designed to be “modular,” which means that you can add multiple batteries with your solar-plus-storage system to scale up your capacity. While a battery’s capacity tells you how big your battery is, it doesn’t tell you how much power a solar battery can provide at a given moment.

How much solar & battery storage do I Need?

Whole home backup is possible, but it takes a large solar system with around 30 kWh of battery storage. Let’s run through an example scenario of powering essential systems during a 24-hour power outage to get an idea of how much solar and battery capacity you’ll need.

Can battery storage power a solar system?

When paired with solar panels, battery storage can power more electrical systems and provide backup electricity for even longer. In fact, a recent study by the Lawrence Berkeley National Laboratory found that when heating and cooling are excluded:.

Can you add battery storage to a solar panel?

The good news is that it’s entirely possible to add battery storage to an existing solar panel setup. So-called “storage ready” systems are already equipped with an inverter that can easily direct excess power into a battery.

But even if your system wasn't designed with storage in mind, you still have options.

How long can a solar battery run a home?

A battery should be sized to run your home for multiple days if it is fully charged, even if your solar panels are not producing energy. According to the US Energy Information Administration (EIA), the average US household uses roughly 30 kilowatt-hours (kWh) of energy per day, and a typical solar battery is typically 10 kWh of capacity.
