# How wide should the nickel strip be for lithium battery packs

## Overview

---

The most commonly available pure nickel strips are 7mm wide, though 10mm is readily available. There are some 47mm strips, but there is a large air gap in the middle. If you need more current, you could always spot-weld 2 to 3 layers of nickel strips on top of each other for more capacity. How to choose a nickel strip for a lithium battery?

The width and material of the nickel strip should be selected according to the current of the lithium battery pack. In terms of material, there are two commonly used nickel strips: pure nickel strips and nickel plated steel. What is the difference between their performance and actual use?

.

What size nickel strips should I buy?

So, keep that in mind when shopping for nickel strips. The most commonly available pure nickel strips are 7mm wide, though 10mm is readily available. There are some 47mm strips, but there is a large air gap in the middle. If you need more current, you could always spot-weld 2 to 3 layers of nickel strips on top of each other for more capacity.

How much current can a nickel strip withstand?

For nickel-plated steel, its calculation formula is usually calculated according to  $7A/mm^2$ , that is to say, the maximum continuous overcurrent of nickel-plated steel with a thickness of  $0.15mm \times 7mm$  is  $7 \times 0.15 \times 7 = 7.35A$ . It can be seen that the current that a pure nickel strip can withstand is about 1.5 times that of nickel plated steel.

What is nickel strip?

Nickel strip is a material often used in series and parallels lithium battery packs. The width and material of the nickel strip should be selected according to the current of the lithium battery pack. In terms of material, there are two commonly used nickel strips: pure nickel strips and nickel plated steel.

What size nickel strip should a welder use?

Most low-cost welders have a hard time around 0.15mm, and most cannot even work with 0.20mm, even on the highest settings. So, keep that in mind when shopping for nickel strips. The most commonly available pure nickel strips are 7mm wide, though 10mm is readily available. There are some 47mm strips, but there is a large air gap in the middle.

What material is used to connect lithium ion batteries?

Nickel is the preferred conductor to connect lithium-ion battery cells together. Nickel strip is the most common material used in lithium-ion battery construction because it is easy to spot weld and has excellent anti-corrosive properties while having a relatively low cost. 99.6% pure nickel strip in a variety of lengths, widths, and thicknesses.
