

SolarMax Energy Systems

Inverter AC side lightning arrester

Overview

The purpose of this Technical Note is to describe proper protection of SolarEdge products in the field from overvoltage surges caused by lightning strikes, grid overvoltage events and ground faults. Properly installed surge protection can reduce the likelihood of permanent damage to inverter components.

Merged North American and Rest-of-World versions Added SPD options for commercial inverters .

A surge protection device alone cannot protect electronic equipment from a direct lightning strike. External protection is required to attract the lightning and redirect it to the ground, while the SPD absorbs residual energy. External protection equipment.

One of the common sources of voltage surge is lightning strikes. It is not necessary for lightning to strike the PV site to damage it; therefore, it is worthwhile to consider all the ways in which lightning can induce surge, including electrostatic and magnetic induction.

Thunderclouds contain negative charges in their lower sections. These high negative charges can induce high positive charges within nearby cables, especially power lines and communication cables. Figure 3: Electrostatic induction - before discharge During.

Inverter AC side lightning arrester

Solar parks - Lightning protection by DEHN

Type 1 combined arresters are installed on the AC side of the string inverter and the low-voltage side of the infeed transformer. The communication interfaces are also provided with adequate ...
