Inverter quality power ratio

Overview

DC/AC ratio, also called inverter loading ratio (ILR), is the array's STC power divided by the inverter's AC nameplate power. $ILR = P_{DC, STC} / P_{AC, rated}$. A higher ILR feeds more energy during long shoulder hours and in winter, at the cost of some midday clipping on clear, cool days. What is a good efficiency rating for an inverter?

Most modern inverters have efficiency ratings between 90% and 98%. Let's break it down: If you feed 1000 watts of DC power into your inverter and it outputs 950 watts of AC power, your inverter efficiency is 95%. The other 50 watts were lost in the conversion process—mostly as heat.

What is inverter efficiency?

In simple terms, inverter efficiency refers to how well an inverter converts DC electricity into usable AC power. No inverter is 100% efficient—some energy always gets lost as heat during the conversion. Most modern inverters have efficiency ratings between 90% and 98%. Let's break it down:

How do you calculate the efficiency of an inverter?

The efficiency of an inverter indicates how much DC power is converted to AC power. Some of the power can be lost as heat, and also some stand-by power is consumed for keeping the inverter in powered mode. The general efficiency formula is: $\eta_{inv} = \frac{P_{AC}}{P_{DC}}$ $\eta_{inv} = \frac{P_{AC}}{P_{DC}}$.

What is a good DC/AC ratio for a solar inverter?

Because the PV array rarely produces power to its STC capacity, it is common practice and often economically advantageous to size the inverter to be less than the PV array. This ratio of PV to inverter power is measured as the DC/AC ratio. A healthy design will typically have a DC/AC ratio of 1.25.

What is the nameplate rating of a solar inverter?

Thus the nameplate rating of the inverter is its capacity to process the power

of the PV array. For example, a 7.6 kW inverter can produce an output of up to 7.6 kW AC. A 9 kW DC solar array rarely produces this much power.

How do I choose a solar inverter?

When designing a solar installation, and selecting the inverter, we must consider how much DC power will be produced by the solar array and how much AC power the inverter is able to output (its power rating).
