

SolarMax Energy Systems

North American rooftop solar power generation systems

Overview

Could solar conversion efficiency improve the rooftop potential?

With improvements in solar conversion efficiency, the rooftop potential in the country could be even greater. Residential and other small rooftops represent about 65% of the national rooftop potential, and 42% of residential rooftops are households with low-to-moderate income.

What is solar rooftop potential?

Solar rooftop potential for the entire country is the number of rooftops that would be suitable for solar power, depending on size, shading, direction, and location. Rooftop potential is not equivalent to the economic or market potential for rooftop solar—it doesn't consider availability or cost.

How much solar power will a new roof generate?

NREL estimates that an average of 3.3 million homes per year will be built or will require roof replacement—representing a potential of roughly 30 gigawatts (GW) of solar capacity per year. If even a small fraction of these new roofs had solar installations, it could have a significant impact on U.S. solar power generation.

Is rooftop solar a good investment?

Rooftop solar has increasingly become an option for many households across the country. Many areas offer attractive Renewable Energy Credits (RECs) that, when coupled with federal and local incentives, can make rooftop solar an attractive financial choice that is also good for the environment.

What is rooftop potential?

Rooftop potential is not equivalent to the economic or market potential for rooftop solar—it doesn't consider availability or cost. Rather, it is the upper limit of solar deployment on rooftops across the country.

Can a solar roof save money in New Jersey?

In 2016, Consumer Reports estimated that a New Jersey home which purchased a solar roof in cash could result in about \$60,000 of savings over 20 years. If the family took out a loan for the entire project, there were still \$20,000 in savings over the same 20 year period.
