

SolarMax Energy Systems

North Korea s first energy storage power station

Overview

What is North Korea's energy infrastructure?

This installment of our series on North Korea's energy infrastructure will examine one of North Korea's largest hydroelectric power installations: Huichon Power Stations No. 1 through 12. Construction of the system first started during the Kim Jong Il era and ended in the Kim Jong Un era.

What role does North Korea play in hydropower development?

North Korea's northeastern provinces, especially Ryanggang Province, play an important role in the country's hydropower development plans. The Paektusan power station project was designed to provide uninterrupted electrical power to this area, where the recently opened showcase city of Samjiyon is situated, to fuel its success.

Will North Korea build 10 hydroelectric power stations downstream from Huichon?

In 2012, North Korea disclosed plans to build 10 new hydroelectric power stations downstream from the two Huichon power stations. The cascade system would see the power plants located one after another along the river and be powered by small dams.

What type of power is used in North Korea?

Hydropower is the dominant form of electricity generation in North Korea. The country's numerous mountains and rivers make it an attractive choice for power generation. As noted in article one of this series, Statistics Korea estimates it accounted for 53 percent of all power generation, while Nautilus Institute put hydro at 76 percent.
