

**SolarMax Energy Systems**

# **Outdoor Power Supply Peak Performance**

## Overview

---

Do power supplies handle peak load peaks?

Power supplies are designed to handle load peaks so that a smaller supply unit can provide long-term reliable service. Systems designers must match not only equipment continuous load to their power supply, but also peak loads, peak load duration, and time between peaks.

Can a power supply supply a peak load?

The expected load is only part of the story. Most applications have a typical load, a maximum load, and brief periods with a peak load that exceeds both typical and maximum. To accommodate this, power supplies can supply peak loads above their maximum rating for a limited time.

Why do high-peak power supply systems need a peak load capacity?

The performance of power supplies in high-peak power applications is essential for reducing grid strain during these periods. With the right peak load capability, a smaller, less expensive supply unit can serve reliably for the life of the installation.

What causes a power supply to peaks?

Peak loads come from inrush current at startup, motor start current spikes, and unconventional conditions that may occur in a power load over and above steady state draw. Power supplies are designed to handle load peaks so that a smaller supply unit can provide long-term reliable service.

Are convection and fan cooled power supplies safe for peak load applications?

Power supplies with a convection rating and a higher fan-cooled rating are often overlooked when considering peak load applications but can be a safe and reliable choice for peak load applications. Such a supply could be rated at up to 50% higher power when fan-cooled, compared to a naturally or convection cooled environment.

What is a good peak pulse for a power supply?

The chart cautions that above 150% (coded in purple) may lead to easy fuse-tripping conditions. A peak pulse of up to 150% of the supply's maximum rated load is reliable for as long as 7.5s. Further examination of the chart shows that the load must drop to 100% or lower for 52.5s after a maximum duration peak load.

## Outdoor Power Supply Peak Performance

---

### What solar panels should be used with outdoor power supply

The selection of solar panels to use with an outdoor power supply depends on several factors. 1. Efficiency, 2. Compatibility, 3. Durability, 4. Size and weight. When ...
