Power generation from large container ships

Overview

Can a large container ship have electric propulsion?

Particularly, a large container ship with electric propulsion will be the key element of global trades for sustainable shipping. This study investigates the combined power cycles for the electric propulsion system in a large container ship. Combined cycles have the primary power machinery and a secondary one.

How much power does a container ship need?

For this particular case study it is assumed one auxiliary engine operates at 30% load, resulting in an average power demand of 329 kW and energy demand of 8,482 kWh per day. For the container ship setup, it is assumed that the shore power infrastructure is not available.

How many configurations of electric propulsion system are suggested in a large container ship?

Three configurations for the electric propulsion system are suggested in a large container ship. Comparative results of three configurations are provided for selecting an appropriate alternative. A methane-fueled marine power plant becomes solely available with a stricter EEDI phase.

How much power does a sustainable ship need?

Sustainable Ships' analysis uses a database of over 3,000 vessels and calculates demand based on auxiliary engine ratings at 30% load. The results vary from 60 kW to 3,825 kW, with an average demand of 584 kW. Only four data points account for the highest outlying values, all except these are below 2,000 kW.

Does a container ship have a propulsion engine?

Large container and other heavy haul ships actually have 1 or more propulsion engines that drive the propeller. They are low speed engines and can run in

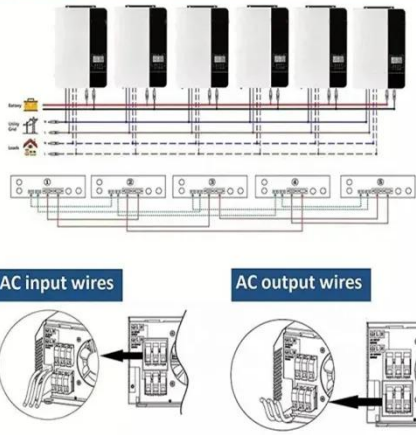

reverse to turn the propeller backwards. They may have a small reduction gearbox but not much of one.

Can grid-connected PV generation systems be integrated with a ship's electrical propulsion system?

On this basis, increases in the installed capacity of PV generation systems in large-scale ships might enable grid-connected PV generation system to be integrated with a ship's electrical propulsion system, offering significant possibilities for ship design in the future.
