

## SolarMax Energy Systems

# Production of hybrid energy for communication base stations

## Overview

---

Does a 5G base station use hybrid energy?

In this paper, hybrid energy utilization was studied for the base station in a 5G network. To minimize AC power usage from the hybrid energy system and minimize solar energy waste, a Markov decision process (MDP) model was proposed for packet transmission in two practical scenarios.

How do hybrid systems work?

The hybrid systems are designed with circuits, simulated, and compared to show their good performance to the base stations. PSIM, PROTEUS, and MATLAB software are used to simulate for evaluating the voltage and the current output of the hybrid systems that meet the power requirements.

What is a hybrid system model?

The hybrid system model is clarified in Section 2, which describes the MDP formulation for transmission probabilities, and the transmission scheme for two practical scenarios. The simulation results are presented in Section 3, and concluding remarks are provided in Section 4.

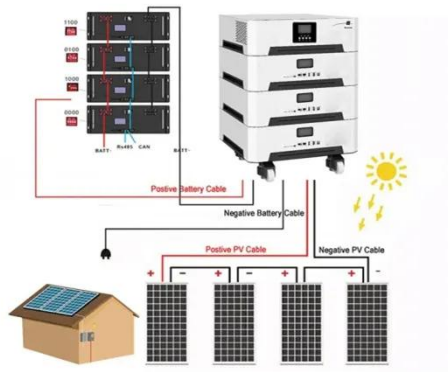

What are the benefits of cellular base station?

Besides, utilizing renewable energy sources in supplying cellular base station (BS) opens the door for multiple benefits. First, the global greenhouse gas (GHG) radiations are decreased significantly. Also, it produces more environmentally friendly such as to reduce foot carbon.

Is there a trade-off between a 5G base station and MDP?

In addition, none of the previous works linked practical transmission scenarios for the MDP model with the study of trade-off among three elements: the minimum dropped packet ratio, the minimum the wastage of solar energy harvesting (SEH), and the minimum AC power utilization was achieved for a 5G base station using the proposed MDP method.
