# Safety Construction Plan for Energy Storage Projects

Our Lifepo4 batteries can be connected in parallels and in series for larger capacity and voltage.

## Overview

---

Why is safety important for energy storage?

Safety is the highest priority for our industry—a commitment reflected by rigorous safety standards and partnerships with the fire service that guide planning, developing, and operating each energy storage project. Fire incidents at energy storage facilities are extremely rare and remain isolated.

What's new in energy storage safety?

Since the publication of the first Energy Storage Safety Strategic Plan in 2014, there have been introductions of new technologies, new use cases, and new codes, standards, regulations, and testing methods. Additionally, failures in deployed energy storage systems (ESS) have led to new emergency response best practices.

Are energy storage facilities safe?

These established safety standards, like NFPA 855 and UL 9540, ensure that all aspects of an energy storage project are designed, built, and operated with safety as the highest priority. Energy storage facilities are monitored 24/7 by trained personnel prepared to maintain safety and respond to emergency events.

What are the energy storage operational safety guidelines?

In addition to NYSERDA's BESS Guidebook, ESA issued the U.S. Energy Storage Operational Safety Guidelines in December 2019 to provide the BESS industry with a guide to current codes and standards applicable to BESS and provide additional guidelines to plan for and mitigate potential operational hazards.

How do you ensure energy storage safety?

Ultimately, energy storage safety is ensured through engineering quality and application of safety practices to the entire energy storage system. Design and planning to prevent emergencies, and to improve any necessary

response, is crucial.

What are the three pillars of energy storage safety?

A framework is provided for evaluating issues in emerging electrochemical energy storage technologies. The report concludes with the identification of priorities for advancement of the three pillars of energy storage safety: 1) science-based safety validation, 2) incident preparedness and response, 3) codes and standards.
