

SolarMax Energy Systems

Single-flow battery electrodes

Overview

Redox flow batteries are an emerging technology for stationary, grid-scale energy storage. Membraneless batteries in particular are explored as a means to reduce battery cost and complexity. Here, a m.

Can single-flow membraneless flow batteries reduce system capital costs?

To reduce system capital costs, single-flow membraneless flow batteries are under intense investigation, but require intricate flow engineering. In this work, we analytically and numerically model the flow and chemical species transport for a novel single-flow geometry, and show enhancement of reactant transport and separation.

What is a membraneless flow battery?

Membraneless flow battery leveraging flow- through heterogeneous porous media for improved power density and reduced crossover P. Leung, X. Li, C. Ponce de León, L. Berlouis, C.T.J. Low, F.C. Walsh Progress in redox flow batteries, remaining challenges and their applications in energy storage.

What is an isothermal membraneless flow battery?

We consider an isothermal membraneless flow battery consisting of two flat electrodes with a single flowing electrolyte between them, operating in a single-pass mode. To illustrate the model, we will utilize zinc-bromine chemistry, where the anode is a zinc metal plate.

Does polybromide affect the boundary layer of a single-flow battery?

For single-flow batteries with multiphase flow, the boundary layer at the bromine electrode is expected to be affected by the presence of the polybromide phase in the electrolyte.

Are flow batteries the future of energy storage?

Flow batteries are promising due to their use of inexpensive, Earth-abundant reactants, and ability to readily upscale because of a spatial decoupling of energy storage and power delivery. To reduce system capital costs, single-

flow membraneless flow batteries are under intense investigation, but require intricate flow engineering.

Does surface active agent affect performance of zinc/bromine redox flow batteries?

Effect of a surface active agent on performance of zinc/bromine redox flow batteries: improvement in current efficiency and system stability Membraneless organic-inorganic aqueous flow batteries with improved cell potential M. Schneider, G.P. Rajarathnam, M.E. Easton, A.F. Masters, T. Maschmeyer, A.M. Vassallo

Single-flow battery electrodes

Preliminary study of single flow zinc-nickel battery

A novel redox flow battery-single flow Zn/NiOOH battery is proposed. The electrolyte of this battery for both negative electrode and positive electrode is high ...
