The latest design of base station on the roof of communication building

Overview

What is a base station?

A base-station is more than just an antenna, and also includes the active electronics feeding the antenna. Buildings may still require rooms with electronics to generate the signal that ends up out at the antenna (although a small cell fed system might reduce room size/qty). This antenna allows flexible placement "remote" of the "base station."

Can a window turn a building into a base station?

The product is "the world's first antenna that turns a window into a base station that can be attached to a building window inside and turn the outdoors into a service area without spoiling the cityscape or the exterior appearance of the building," says Shota Ochiai, a marketing manager at AGC.

What is a mmWave base station?

This new form of base station architecture is engineered on the concept of Massive MIMO (multiple input, multiple output) and beamforming, which enable mmWave transmission and, as such, enable the evolution of commercial 5G and beyond.

What is a 4G base station?

The base station sits at the heart of the network platform. Traditional 4G LTE base stations contain one, two or possibly even four transmitters and usually operate on core band frequencies of up to 2.5 GHz, sometimes even 3.5 GHz and 5 GHz.

How many cables do you need to test a base station?

Up until this point, the methods used to specify, measure and regulate traditional base station transmission and reception had been fully conducted (i.e. taken at the antenna connector). This meant that activity of testing would in theory require up to 256 cables to be manually attached to the base

station.
