

## SolarMax Energy Systems

# Uruguayan monocrystalline silicon photovoltaic panels

## Overview

---

What is a monocrystalline silicon cell?

Monocrystalline silicon cells are defined as photovoltaic cells produced from single silicon crystals using the Czochralski method, characterized by their high efficiency of 16 to 24%, dark colors, and a power output per unit area ranging from 75 to 155 Wp/m<sup>2</sup>. They typically have a more circular shape compared to multi-crystalline cells.

Why is monocrystalline silicon used in photovoltaic cells?

In the field of solar energy, monocrystalline silicon is also used to make photovoltaic cells due to its ability to absorb radiation. Monocrystalline silicon consists of silicon in which the crystal lattice of the entire solid is continuous. This crystalline structure does not break at its edges and is free of any grain boundaries.

How are monocrystalline silicon PV cells made?

Monocrystalline silicon PV cells are produced with the Czochralski method, generated from single silicon crystals. Their manufacturing process is quite expensive since they require a specific processing period. Their energy pay-back time is around 3–4 years (Ghosh, 2020).

What is a monocrystalline silicon solar module?

Monocrystalline silicon represented 96% of global solar shipments in 2022, making it the most common absorber material in today's solar modules. The remaining 4% consists of other materials, mostly cadmium telluride. Monocrystalline silicon PV cells can have energy conversion efficiencies higher than 27% in ideal laboratory conditions.

Why are solar cells dominated by monocrystalline silicon?

It is noted that the solar cell market is dominated by monocrystalline silicon cells due to their high efficiency. About two decades ago, the efficiency of

crystalline silicon photovoltaic cells reached the 25% threshold at the laboratory scale. Despite technological advances since then, peak efficiency has now increased very slightly to 26.6%.

How much power does a monocrystalline silicon cell have?

Monocrystalline silicon cells' power per unit area varies between 75 and 155 Wp/m<sup>2</sup> (Petter Jelle et al., 2012). They have a more circular cell shape than multi-crystalline cells (Tripathy et al., 2016).

## Uruguayan monocrystalline silicon photovoltaic panels

---

### High-efficiency Module, Longi solar module

LONGi launched its mono-PERC modules in 2016, featuring integrated PERC technology on monocrystalline silicon and low light degradation, and its cell ...
