

## SolarMax Energy Systems

# Use of bifacial solar panels in Croatia

## Overview

---

Are bifacial solar panels suitable for rooftop installations?

Bifacial solar panels are not suitable for rooftop installations but may work well with residential ground-mounted solar systems. The ideal use case for bifacial solar panels is in commercial and utility-scale solar installations.

Are bifacial solar panels effective?

Bifacial solar panels can be effective when installed on elevated structures such as solar carports, canopies and pergolas. Elevation allows more sunlight to reflect off surrounding surfaces and reach the underside of these panels, increasing energy production.

Are bifacial panels more energy efficient?

With more surface area available to absorb sunlight, bifacial panels are generally more efficient than traditional monofacial panels. For example, a study by solar panel manufacturer LONGi found that bifacial panels produced 11% more energy than standard panels as part of a ground-mounted installation.

Can bifacial panels be installed vertically?

Vertical & Special Installations: With relatively less reliance on direct light, bifacial panels can be installed vertically, which is particularly beneficial in special installations such as vertical street lights, bifacial solar fences and bifacial solar facades.

What is bifacialize solar?

The term 'bifacialize' isn't widely used in the industry, but it refers to the process of designing and manufacturing solar panels to harness energy from both the front and back sides, boosting overall efficiency and energy output.

How do bifacial solar panels work?

One round of operation ends for a monofacial panel after the incident light strikes the front side of the panel and is absorbed and converted into electricity. For a bifacial solar panel, in addition for front-side conversion, part of the direct light would pass through the panel and be reflected back to the rear side by the surface below.
