What equipment does the mine communication base station have

Overview

What is a mining communication base station?

Our mining communication base stations are innovatively built to fit your specific project's needs. Our semi-portable LTE base stations are modular, standalone, fully self-supporting units forging the way in long range communications solutions for remote mining operations. Mining relies on communication technology.

What is a communication base station?

Communication base station setups will usually include a wide array of different technologies, including power supplies, data servers, head end, radio repeaters, and communication systems that allow for high-speed continuous information flow. It can also be used as part of a leaky feeder system in the communication network.

What is a base station in a mine?

Fixed Base Stations: Installed at strategic points within the mine, base stations facilitate communication by acting as relay points between handheld radios and the surface. These stations ensure coverage over a large area, allowing workers to remain in contact even when they are far from each other.

What type of communication system do mines use?

For stationary units or worksites, cable-based (wired) communication systems are normally adequate; wireless systems should be used for mobile units. There is a tendency for underground mines to use a single communication network for both voice and data.

Can a mining base station be used as a communications tower?

Our mining communication base stations can also host mast systems up to 32 metres high, depending on your selected model, meaning it can easily be used as an off-grid communications tower. Or use our base station next to a

fixed tower for power and communications without the need for site services.

What audio communication systems are suitable for underground mines?

There are several audio communications systems that are suitable for underground mines (Table 6). The systems range from very simple to very complex. One simple option is a mine phone system. A battery-operated phone is placed at a control location at the surface or entrance into the mine.

What equipment does the mine communication base station have

Underground Mine Communication Infrastructure Guidelines

The backbone/core communications system could be hybrid leaky feeder supporting digital communications, Wi-Fi®, fibre optic cabling, or a combination of technologies to provide the ...
