

## SolarMax Energy Systems

# What is the reason for the zero current in the battery cabinet

## Overview

---

Why is my lithium battery showing zero voltage?

Well, there is a possibility, and a point might come where you will read zero voltage in a lithium battery. It means there is no power left inside the batteries. Following are a few possible reasons why your lithium batteries are showing zero voltage: Hibernation Mode under 2 Volts.

Is a lithium battery zero voltage irreparable?

Lithium battery zero voltage is a common problem, but not all zero voltage batteries are irreparable. By understanding the causes of zero voltage and taking appropriate recovery and prevention measures, you can maximize the life of your lithium battery and ensure the safe operation of your equipment.

What happens if a zero voltage lithium battery is restored?

Even if a zero voltage lithium battery is successfully restored, its performance may be affected: Capacity reduction: The battery's discharge capacity may be reduced to 80~90%, resulting in a shorter battery life. Increased internal resistance: The internal resistance of the battery may increase, resulting in a decrease in output power.

Why is my lithium battery not charging properly?

Aging: Over time, lithium batteries degrade in performance and their internal resistance increases. This can cause the battery to be unable to maintain sufficient voltage and eventually show zero voltage. Faulty charger: Using a faulty charger may cause the battery to not charge properly and eventually drain to zero voltage.

What happens if a battery doesn't charge on time?

Didn't charge on time. If you have been using the battery but not charging it, its performance will be affected. The battery will show low voltage, which might show zero voltage. It is important to recharge the battery on time;

otherwise, zero voltage situations will happen.

What does a zero volt battery mean?

When you measure your battery's output terminals and get zero volts, it typically means: This does not always mean your battery is destroyed—it may just be in safe mode, waiting to be reset properly.

1. Over-Discharge Protection If the battery's voltage drops too low, the BMS will disconnect the output circuit to prevent further cell damage.
- 2.
