

SolarMax Energy Systems

Wind power container energy storage

Overview

What is a containerized energy storage system?

A Containerized Energy-Storage System, or CESS, is an innovative energy storage solution packaged within a modular, transportable container. It serves as a rechargeable battery system capable of storing large amounts of energy generated from renewable sources like wind or solar power, as well as from the grid during low-demand periods.

Does a wind turbine have built-in energy storage?

At no point during the normal operation of a wind turbine is there built-in power storage. However, wind turbine operators can add power storage methods into the system, such as a battery, to store energy.

How can wind energy be stored in a battery system?

The project aims to store wind energy from a wind turbine in a Lithium-Ion Battery to manage fluctuations in power demand and frequencies. The battery system is modeled using Simulink software to store up to 10 MW of energy from the wind power system.

How much wind can a shipping container withstand?

The measure of how much force can be applied to the top edge before the container begins to collapse or warp can be translated into an equivalent wind load. According to the standards of the rigidity test, a shipping container can withstand wind speeds of 180 mph without wavering.

Can I add more container units to my energy storage system?

Each container unit is a self-contained energy storage system, but they can be combined to increase capacity. This means that as your energy demands grow, you can incrementally expand your CESS by adding more container units, offering a scalable solution that grows with your needs.
